1 Quick Guide for the Impatient

1. MLN depends on the following software:

- Perl
- uml-utils
- bridge-utils
- screen
- sudo

2. Download MLN:

- `wget http://mln.sourceforge.net/files/mln-latest.tar.gz`
- `tar xzf mln-latest.tar.gz`

3. Run the interactive setup:

- `cd mln-latest`
- `./mln setup`
- During the setup process, accept all defaults by simply hitting Return at each prompt.

4. Build an example project:

- `./mln build -f examples/simple-network.mln`

5. Start your new virtual network:

- `./mln start -p simple-network`

6. Now you should have 3 xterms, one for each virtual host in the **simple-network** project. Login as root to each one (no password) and play!

7. Stop your new virtual network:

- `./mln stop -p simple-network`
